Review: Software Architectural Design process

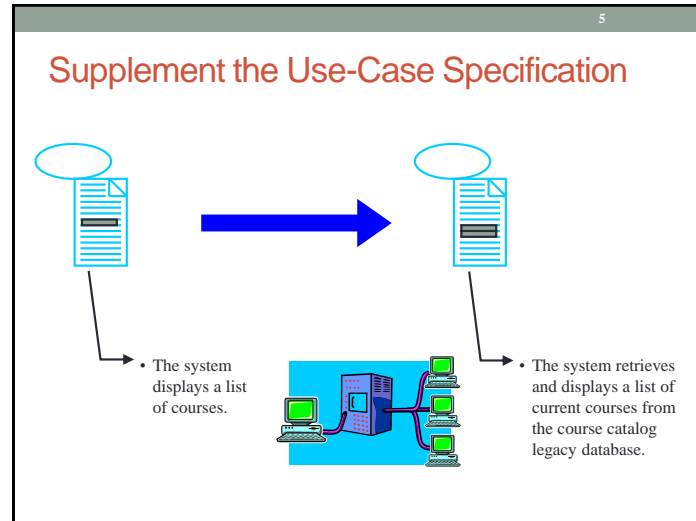

- Purpose: “to provide a design for the software that implements and can be verified against the requirements”
- Software architecture is designed from the software requirements
- Main items
 - a top-level structure of the software and the software components which constructs the software
 - a top-level design for the interfaces external to the software and between the software components
 - a top-level design for the database

3

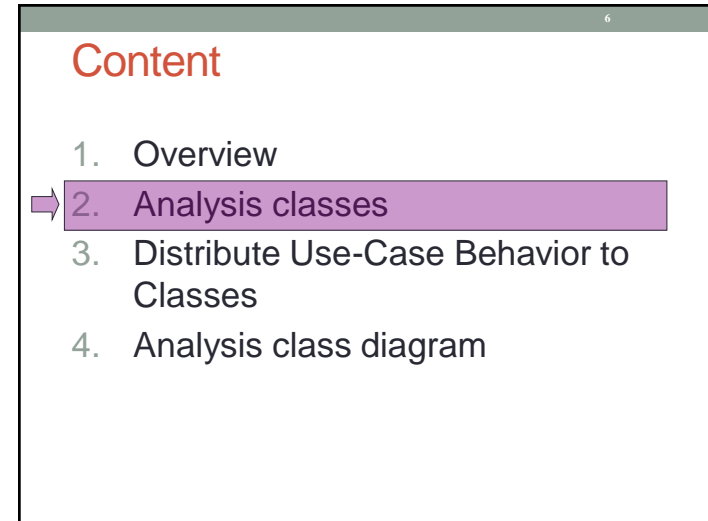

Architectural Design Overview

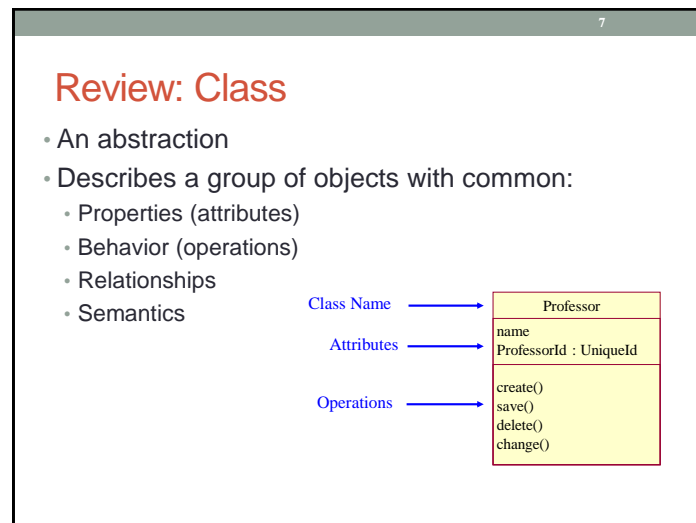

4

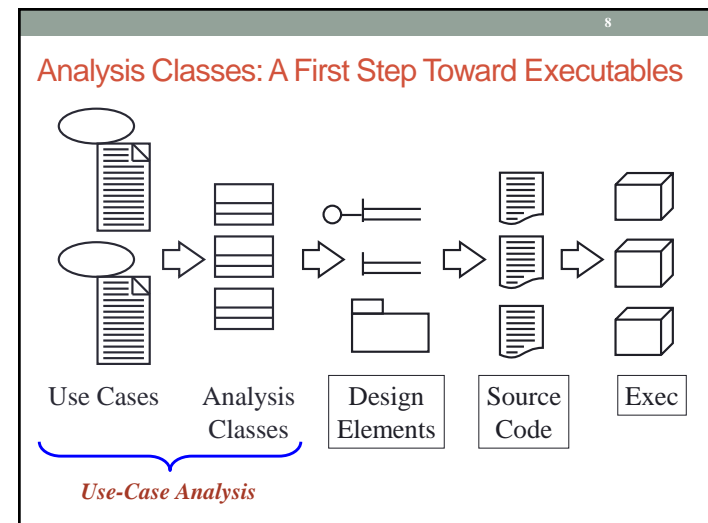

5

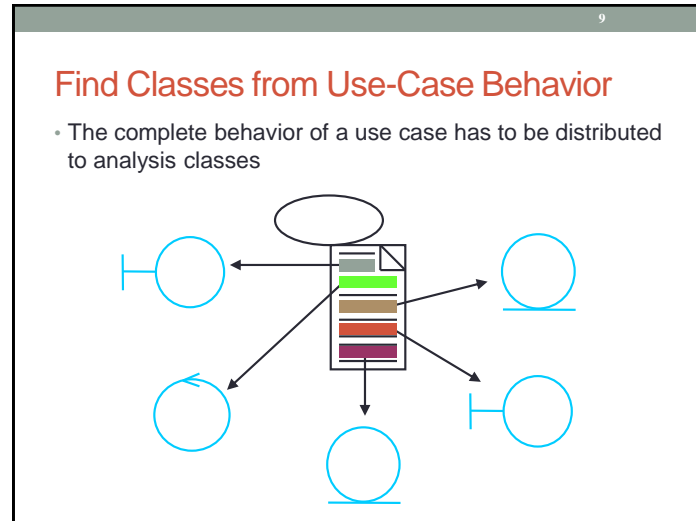

6

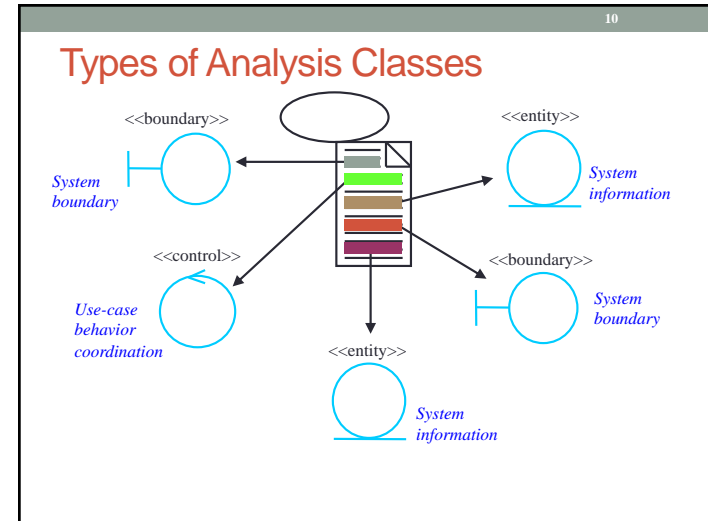

7

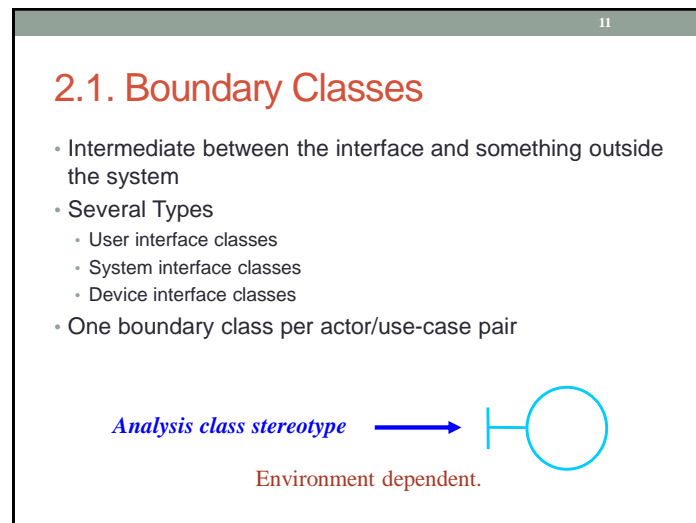

8

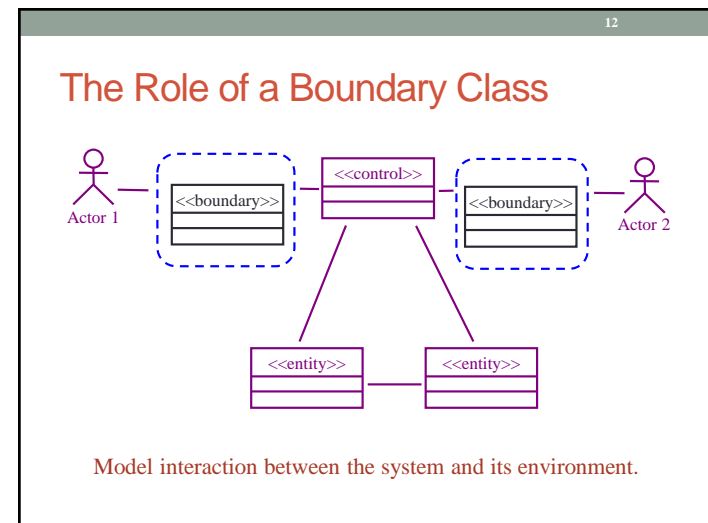

9

10

11

12

Example in Course Registration CS: Finding Boundary Classes

- One boundary class per actor/use case pair

13

Guidelines: Boundary Classes

- User Interface Classes
 - Concentrate on what information is presented to the user
 - Do NOT concentrate on the UI details
- System and Device Interface Classes
 - Concentrate on what protocols must be defined
 - Do NOT concentrate on how the protocols will be implemented

Concentrate on the responsibilities, not the details!

14

2.2. Entity Classes

- Key abstractions of the system

Environment independent.

15

The Role of Entity Classes

Store and manage information in the system.

16

Guidelines: Entity Classes

- Use use-case flow of events as input
- Key abstractions of the use case
- Traditional, filtering nouns approach
 - Underline noun clauses in the use-case flow of events
 - Remove redundant candidates
 - Remove vague candidates
 - Remove actors (out of scope)
 - Remove implementation constructs
 - Remove attributes (save for later)
 - Remove operations

17

Example in Course Registration CS: Finding Entity Classes

- For “Register For Course” use case, there are some candidate entity classes:

18

3.3. Control Classes

- ◆ Provide coordinating behavior in the system
- ◆ model control behavior specific to one or more use cases

Use-case dependent. Environment independent.

19

The Role of Control Classes

Coordinate the use-case behavior.

20

Guidelines: Control Classes

- ◆ In general, identify one control class per use case.
- ◆ The system can perform some use cases without control classes by using just entity and boundary classes.
 - This is particularly true for use cases that involve only the simple manipulation of stored information.
- ◆ More complex use cases generally require one or more control classes to coordinate the behavior of other objects in the system.
 - Examples of control classes include transaction managers, resource coordinators, and error handlers.

21

Example in Course Registration CS: Finding Control Classes

- For “Register for Course” use case:

22

Course Registration CS Summary: Analysis Classes

Use-Case Model

Analysis Model

23

Content

1. Overview
2. Analysis classes
3. Distribute Use-Case Behavior to Classes
4. Analysis class diagram

24

3. Distribute Use-Case Behavior to Classes

- For each use-case flow of events:
 - Identify analysis classes
 - Allocate use-case responsibilities to analysis classes
 - Model analysis class interactions in Interaction diagrams

25

3.1. Allocating Responsibilities to Classes

- Use analysis class stereotypes as a guide
 - Boundary Classes
 - Behavior that involves communication with an actor
 - Entity Classes
 - Behavior that involves the data encapsulated within the abstraction
 - Control Classes
 - Behavior specific to a use case or part of a very important flow of events

26

3.1. Allocating Responsibilities to Classes (2)

- Who has the data needed to perform the responsibility?
 - If one class has the data, put the responsibility with the data
 - If multiple classes have the data:
 - Put the responsibility with one class and add a relationship to the other
 - Create a new class, put the responsibility in the new class, and add relationships to classes needed to perform the responsibility
 - Put the responsibility in the control class, and add relationships to classes needed to perform the responsibility

27

3.2. Interaction Diagrams

- Generic term that applies to several diagrams that emphasize object interactions
 - Sequence Diagram
 - Communication Diagram
- Specialized Variants
 - Timing Diagram
 - Interaction Overview Diagram

28

3.2. Interaction Diagrams (2)

◆ Sequence Diagram

- Time oriented view of object interaction

◆ Communication Diagram

- Structural view of messaging objects

29

3.2. Interaction Diagrams (3)

• Timing Diagram

- Time constraint view of messages involved in an interaction

• Interaction Overview Diagram

- High level view of interaction sets combined into logic sequence

30

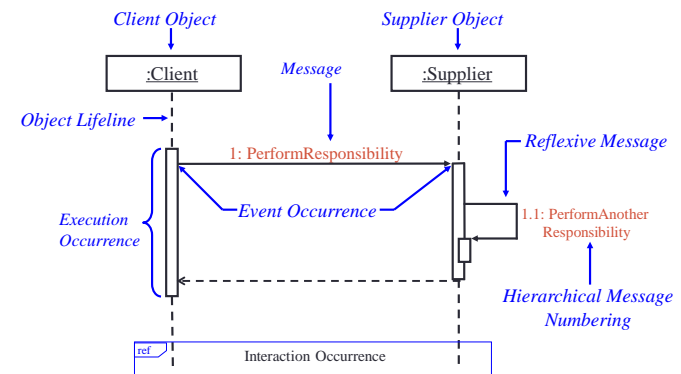

3.2.1. Sequence Diagram

- A sequence diagram is an interaction diagram that emphasizes the time ordering of messages.
- The diagram shows:
 - The objects participating in the interaction.
 - The sequence of messages exchanged.

31

The Anatomy of Sequence Diagrams

32

Exercise: Course Registration CS

- Draw a sequence diagram for “Register for course” use case

33

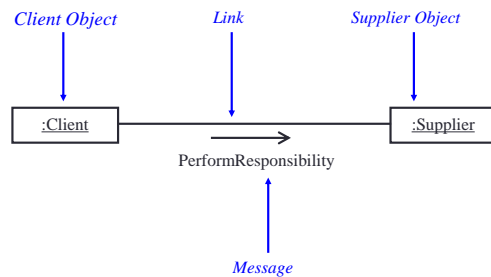

3.2.2. Communication Diagram

- A communication diagram emphasizes the organization of the objects that participate in an interaction.
- The communication diagram shows:
 - The objects participating in the interaction.
 - Links between the objects.
 - Messages passed between the objects.

34

The Anatomy of Communication Diagrams

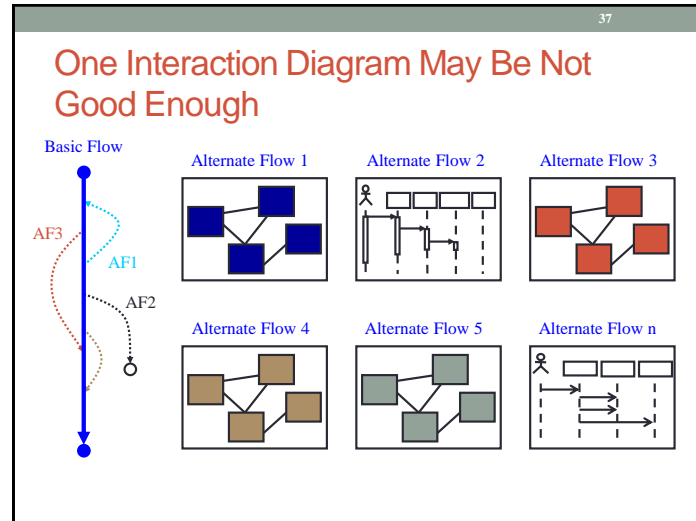

35

Exercise: Course Registration CS

- Draw a communication diagram for “Register for course” use case

36

37

38

3.2.3. Sequence and Communication Diagram Comparison

- Similarities
 - Semantically equivalent
 - Can convert one diagram to the other without losing any information
 - Model the dynamic aspects of a system
 - Model a use-case scenario

38

39

3.2.3. Sequence and Communication Diagram Comparison (2)

Sequence diagrams	Communication diagrams
<ul style="list-style-type: none"> ▪ Show the explicit sequence of messages ▪ Show execution occurrence ▪ Better for visualizing overall flow ▪ Better for real-time specifications and for complex scenarios 	<ul style="list-style-type: none"> ▪ Show relationships in addition to interactions ▪ Better for visualizing patterns of communication ▪ Better for visualizing all of the effects on a given object ▪ Easier to use for brainstorming sessions

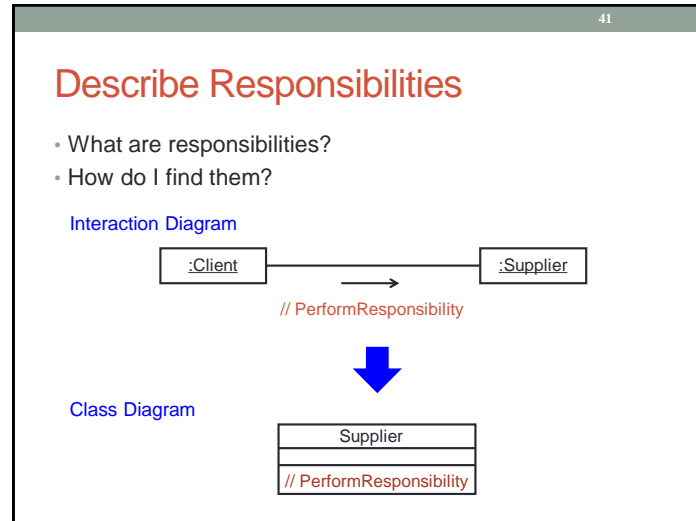

39

40

41

42

43

44

Review points: Message Design

- Have all the main and/or sub-flows been handled, including exceptional cases?
- Have all the required objects been found?
- Have all behaviors been unambiguously distributed to the participating objects?
- Have behaviors been distributed to the right objects?
- Where there are several Interaction diagrams, are their relationships clear and consistent?

45

Question?

46
